

CYBER WARGAMING

Application of Defence consultancy, advanced data engineering, data science and cutting-edge visualisation techniques to quantify the impact of cyber event against information systems.

THE CHALLENGE

Vulnerability to cyber incidents is a well-known and publicised risk to Defence activities. Hostile actors are known to specifically target Defence and associated industry Information Systems, seeking to disrupt activity, gain intelligence to influence current and future conflicts and interrogate data to gain unfair commercial advantage.

THE SOLUTION

Using advanced data engineering and data science techniques, we quantified and illustrated the commercial and operational risks of hostile actors gaining access to large IT systems. This has enabled recommendations for removal and reclassification of data sources, and longer-term improvements in threat protection delivered by future IS programmes and MOD's cyber resilience against an ever-increasing threat backdrop.

THE BENEFITS

Actionable insights for senior owners

Cyber risk quantification for large, critical information systems

Rapid 10 week delivery
